

What are Props in React?

Props (Properties) React mein use hoti hain **data ko ek component se doosre component (parent → child)** bhejne ke liye.

Why we use Props?

React ka main concept hai **component-based architecture**. Props ki madad se hum:

- Components ko **dynamic** banate hain
- **Reusable** components create karte hain
- Parent se child tak **data pass** karte hain

Benefits of Props

1. Reusability

Ek hi component ko different data ke sath reuse kar sakte hain.

```
<Child name="Ali" age={10} />  
<Child name="Ahmed" age={12} />
```

Same component, different output.

2. Clean & Modular Code

Code small components mein divide hota hai → easy to manage &

understand. **3. Dynamic Data**

Hardcoding ki zarurat nahi hoti — data change karo, UI automatically update ho jata hai.

4. One-Way Data Flow

Data **sirf parent se child** jata hai

5. Separation of Concerns

Parent data handle karta hai, child sirf display karta hai.

Father.jsx

```
import Child from "../Child";

function Father() {
  return (
    <>
      <h1>I am Father</h1>
      <Child name="Ali" age={10} />
      <Child name="Ahmed" age={12} />
    </>
  );
}

export default Father;
```

Child.jsx

```
function Child(props) {
  return (
    <>
      <h2>I am Child</h2>
      <p>Name: {props.name}</p>
      <p>Age: {props.age}</p>
    </>
  );
}

export default Child;
```

App.jsx

```
import Father from "../myComponents/Father"

function App() {
  return(
    <Father/>
  )
}

export default App
```
